

Deep Dive monitoring for
Web Based Applications

24x7 WEB Performance Analytics

WEB Tuna

Key Benefits

- Simple installation
- Fully hosted solution
- Just a 4K JavaScript file to add to your site
- Measures the real end user experience for all visitors to your site
- Passive monitoring not synthetic transactions
- Real-Time view and historical reports

Supported Environments

Any website or web based application

What is WebTuna?

WebTuna is the revolutionary on-demand service for alerting and monitoring the performance of your internet or intranet sites and applications. WebTuna monitors the real user experience (not synthetic HTTP or ping response times) for every page view from every visitor to your site.

WebTuna is offered as a fully hosted Software-as-a-Service (SaaS) solution which means all you need to do is to add our JavaScript to 'tag' your pages and we will collect all the performance metrics for you, store them and give you secure access to the views and reports through your web browser.

WebTuna lets you know exactly how each page on your website is performing for each individual user both in real-time and through historical reporting to see trends in your web site performance or usage.

It can provide pro-active email alerting to let you know immediately when there are current performance problems on your site.

Rapid ROI

WebTuna can be installed and monitoring within minutes, which means that the information can be used straightaway to solve real business issues and deliver immediate value.

We recommend  **optimize**
for website acceleration

Who Is It For?

- Sharepoint Administrators
- Web Administrators
- Web Marketing Experts
- Application Owners
- Performance Testers

Problems Solved

- End User Bottlenecks
- Random Performance Spikes
- Slow Page Performance

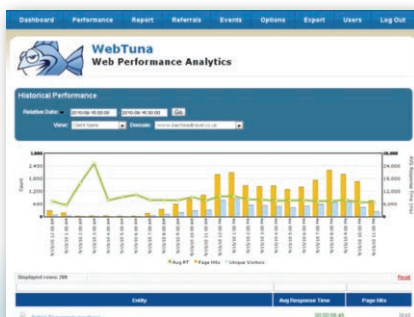

Real time visualization of your end users

End User Analysis

The WebTuna GeoDashboard allows real time visualization of how many users are on your site(s) and where they are coming from by overlaying them onto Google Maps. The size of bubble indicates the number of users and the colour indicates the user experience they are receiving.

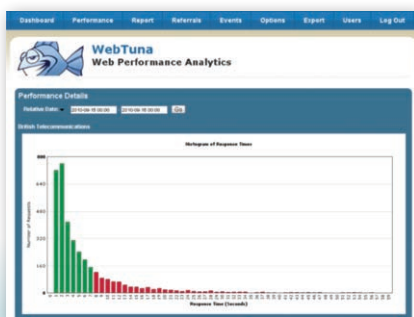

Drilldown into any user to view their details, click stream, and performance characteristics

Profile historical activity and performance

Historical Performance

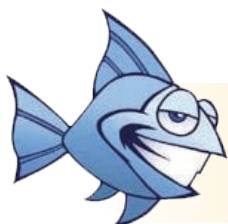

- View in real-time or historically the activity and performance of your website visitors
- Capture the response time of each and every page on your site, and for all users, in order to quickly isolate any performance issues before they impact your business
- Correlate detailed information on your users in order to help with your sales and marketing efforts
- Receive performance and analytics email Alerts

Distribution of web page response times

Site Performance Analysis

- View a histogram distribution of end user response times for any page
- Compare performance to a pre-defined Service Level Agreement (SLA) so you can find out if you are delivering acceptable service to you end users
- Find out how many pieces of content each page is serving in order to quickly identify potential latency bottlenecks
